Chapter 1

Class Index

1.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

Administration	5
BlockTable	7
Parser	9
Scanner	20
SymbolTable	22
TableEntry	25
Token	27

Chapter 2

File Index

2.1 File List

Here is a list of all files with brief descriptions:

Administration.h	31
BlockTable.h	31
Grammar.h	32
Parser.h	34
Scanner.h	34
Symbol.h	35
SymbolTable.h	38
TableEntry.h	38
Token.h	38
Types.h	39

Chapter 3

Class Documentation

3.1 Administration Class Reference

```
#include <Administration.h>
```

Public Member Functions

- [Administration](#) (std::ostream &[fout](#), [Scanner](#) &sc, bool [debug](#)=false)
Creates a new [Administration](#) object.
- [Token](#) [getToken](#) ()
- void [newLine](#) ()
Adds line number and resets [correctLine](#).
- void [debugInfo](#) (std::string text)
Print debugging info to the console if in debug mode.
- void [error](#) (std::string text)
Display text for an error.

Private Member Functions

- void [checkError](#) ([Token](#) ntoken)
Checks if current token is an error token.

Private Attributes

- std::ostream & [fout](#)
File to print all tokens to.
- [Scanner](#) & [scanner](#)
The scanner to use on the input.
- int [lineNum](#)
The current line number.
- bool [correctLine](#)
True if the line has no errors so far.
- int [errorCount](#)
The total number of errors so far.
- bool [debug](#)
Whether or not to print debugging info.

3.1.1 Constructor & Destructor Documentation

3.1.1.1 Administration::Administration (std::ostream & *fout*, Scanner & *sc*, bool *debug* = false)

Creates a new [Administration](#) object.

Parameters

<i>fout</i>	The output file stream.
<i>sc</i>	The scanner beign used by administration.
<i>debug</i>	Set debug mode. Default false.

3.1.2 Member Function Documentation

3.1.2.1 void Administration::checkError (Token *ntoken*) [private]

Checks if current token is an error token.

Parameters

<i>ntoken</i>	The current token.
---------------	--------------------

3.1.2.2 void Administration::debugInfo (std::string *text*)

Print debugging info to the console if in debug mode.

Parameters

<i>text</i>	The info to print.
-------------	--------------------

3.1.2.3 void Administration::error (std::string *text*)

Display text for an error.

Parameters

<i>text</i>	The error message.
-------------	--------------------

3.1.2.4 Token Administration::getToken ()

3.1.2.5 void Administration::newLine ()

Adds line number and resets correctLine.

3.1.3 Member Data Documentation

3.1.3.1 bool Administration::correctLine [private]

True if the line has no errors so far.

3.1.3.2 bool Administration::debug [private]

Wether or not to print debugging info.

3.1.3.3 int Administration::errorCount [private]

The total number of errors so far.

3.1.3.4 std::ostream& Administration::fout [private]

File to print all tokens to.

3.1.3.5 int Administration::lineNum [private]

The current line number.

3.1.3.6 Scanner& Administration::scanner [private]

The scanner to use on the input.

The documentation for this class was generated from the following file:

- [Administration.h](#)

3.2 BlockTable Class Reference

```
#include <BlockTable.h>
```

Public Member Functions

- [BlockTable](#) ()
Default Constructor for a [BlockTable](#).
- bool [search](#) (int lookId)
Searches the current level of the blocktable for a table entry.
- bool [define](#) (int nid, [Kind](#) nkind, [Type](#) ntype, int nsize, int nval)
Creates a new table entry and puts it into the current block if it doesnt already exist.
- bool [define](#) ([TableEntry](#) &entry)
Overloaded define function that takes in a table entry to define.
- [TableEntry](#) [find](#) (int lookId, bool &error)
Searches the entire blocktable for the table entry.
- bool [pushBlock](#) ()
Creates and pushes a new blocktable onto the current block.
- void [popBlock](#) ()
Removes the highest level (most recent) block of the blocktable.

Private Attributes

- std::vector< std::map< int, [TableEntry](#) > > [table](#)
Vector of maps storing the table entries for a block (the block table)
- int [blockLevel](#)
The current blocklevel.

3.2.1 Constructor & Destructor Documentation

3.2.1.1 BlockTable::BlockTable ()

Default Constructor for a [BlockTable](#).

3.2.2 Member Function Documentation

3.2.2.1 bool BlockTable::define (int *nid*, Kind *nkind*, Type *ntype*, int *nsize*, int *nval*)

Creates a new table entry and puts it into the current block if it doesnt already exist.

Parameters

<i>nid</i>	The id of the table entry
<i>nkind</i>	The kind of the table entry
<i>ntype</i>	The type of the table entry
<i>nsize</i>	The memory size required by the table entry
<i>nval</i>	The value of the table entry

3.2.2.2 bool BlockTable::define (TableEntry & *entry*)

Overloaded define function that takes in a table entry to define.

Parameters

<i>entry</i>	The table entry that will be define
--------------	-------------------------------------

3.2.2.3 TableEntry BlockTable::find (int *lookId*, bool & *error*)

Searches the entire blocktable for the table entry.

Parameters

<i>lookId</i>	The id of the table entry being searched for
<i>error</i>	The error check for when the table entry does not exist

3.2.2.4 void BlockTable::popBlock ()

Removes the highest level (most recent) block of the blocktable.

3.2.2.5 bool BlockTable::pushBlock ()

Creates and pushes a new blocktable onto the current block.

3.2.2.6 bool BlockTable::search (int *lookId*)

Searches the current level of the blocktable for a table entry.

Parameters

<i>lookID</i>	The id of the table entry being searched for
---------------	--

3.2.3 Member Data Documentation

3.2.3.1 int BlockTable::blockLevel [private]

The current blocklevel.

3.2.3.2 std::vector<std::map<int, TableEntry> > BlockTable::table [private]

Vector of maps storing the table entries for a block (the block table)

The documentation for this class was generated from the following file:

- [BlockTable.h](#)

3.3 Parser Class Reference

```
#include <Parser.h>
```

Public Member Functions

- [Parser](#) ([Administration](#) &[admin](#))
Creates a new [Parser](#) object.
- void [parse](#) ()
Parses a PL program.

Private Member Functions

- void [match](#) ([Symbol](#) symbol, std::set< [Symbol](#) > stop)
Match a [Token](#) and move to the next one.
- void [syntaxError](#) (std::set< [Symbol](#) > stop)
Process a syntax error and perform error recovery.
- void [syntaxCheck](#) (std::set< [Symbol](#) > stop)
Checks the next token to see if it will be valid.
- void [program](#) (std::set< [Symbol](#) > stop)
Parses a program from the stream of tokens.
- void [block](#) (std::set< [Symbol](#) > stop, std::vector< [TableEntry](#) > entries=std::vector< [TableEntry](#) >())
Parses a block from the stream of tokens.
- void [defPart](#) (std::set< [Symbol](#) > stop)
Parses a definition part from the stream of tokens.
- void [def](#) (std::set< [Symbol](#) > stop)
Parses a definition from the stream of tokens.
- void [constDef](#) (std::set< [Symbol](#) > stop)
Parses a constant definitions from the stream of tokens.
- void [procDef](#) (std::set< [Symbol](#) > stop)
Parses a procedure definition from the stream of tokens.
- void [stmtPart](#) (std::set< [Symbol](#) > stop)
Parses the statement part of the program.

- void `stmt` (std::set< `Symbol` > stop)
Parses a statement.
- void `emptyStmt` (std::set< `Symbol` > stop)
Parses an empty statement.
- void `readStmt` (std::set< `Symbol` > stop)
Parses a read statement.
- void `writeStmt` (std::set< `Symbol` > stop)
Parses a write statement.
- void `assignStmt` (std::set< `Symbol` > stop)
Parses an assignment statement.
- void `procStmt` (std::set< `Symbol` > stop)
Parses a procedure call.
- void `ifStmt` (std::set< `Symbol` > stop)
Parses an if statement.
- void `doStmt` (std::set< `Symbol` > stop)
Parses a do statement.
- std::vector< `Type` > `vacsList` (std::set< `Symbol` > stop)
Parses a variable access list.
- `Type` `varAccess` (std::set< `Symbol` > stop)
Parses variable access.
- void `varDef` (std::set< `Symbol` > stop)
Parses a variable definition from the stream of tokens.
- void `vPrime` (std::set< `Symbol` > stop, `Type` type)
Parses a variable vs array from the stream of tokens.
- std::vector< int > `varList` (std::set< `Symbol` > stop)
Parses a variable list from the stream of tokens.
- `Type` `idxSelect` (std::set< `Symbol` > stop, `TableEntry` entry)
Parses an index selector.
- std::vector< `Type` > `exprList` (std::set< `Symbol` > stop)
Parses a expression list from the stream of tokens.
- `Type` `expr` (std::set< `Symbol` > stop)
Parses a expression from the stream of tokens.
- `Type` `primeExpr` (std::set< `Symbol` > stop)
Parses a primary expression from the stream of tokens.
- `Type` `simpleExpr` (std::set< `Symbol` > stop)
Parses a simple expression from the stream of tokens.
- void `guardedList` (std::set< `Symbol` > stop)
Parses a list of guarded commands.
- void `guardedComm` (std::set< `Symbol` > stop)
Parses a guarded command.
- `Type` `term` (std::set< `Symbol` > stop)
Parses a term from the stream of tokens.
- `Type` `factor` (std::set< `Symbol` > stop)
Parses a factor from the stream of tokens.
- void `primeOp` (std::set< `Symbol` > stop)
Parses a primary operator from the stream of tokens.
- void `relOp` (std::set< `Symbol` > stop)
Parses a relational operator from the stream of tokens.
- void `addOp` (std::set< `Symbol` > stop)
Parses a plus or minus operator from the stream of tokens.
- void `multOp` (std::set< `Symbol` > stop)

- Parses a multiplication or division or modulus operator from the stream of tokens.*
- [Type constant](#) (std::set< [Symbol](#) > stop)
 - Parses a const non-terminal.*
- [Type cPrime](#) (std::set< [Symbol](#) > stop)
 - Parses a const num non-terminal.*
- [Type typeSym](#) (std::set< [Symbol](#) > stop)
 - Parses a definition type from the stream of tokens.*
- void [boolSym](#) (std::set< [Symbol](#) > stop)
 - Parses a true or false from the stream of tokens.*
- void [fieldList](#) (std::set< [Symbol](#) > stop, std::vector< [TableEntry](#) > &fields)
 - Parses the a list of all the fields and their corresponding types declared.*
- void [recordSection](#) (std::set< [Symbol](#) > stop, std::vector< [TableEntry](#) > &fields)
 - Parses a list of idetifiers of the same type declared in a record.*
- void [procBlock](#) (std::set< [Symbol](#) > stop, int id)
 - Parses the block for a procedure declaration.*
- void [formParamList](#) (std::set< [Symbol](#) > stop, std::vector< [TableEntry](#) > ¶ms)
 - Parses the parameter list when a procdure is being declared.*
- void [paramDef](#) (std::set< [Symbol](#) > stop, std::vector< [TableEntry](#) > ¶ms)
 - Parses a list of idetifiers being passed into the procedure, can be tagged with "var" meaning it is pass by reference, pass by value otherwise.*
- std::vector< [Type](#) > [actParamList](#) (std::set< [Symbol](#) > stop)
 - Parases the list of parameters when a procedure is being called.*
- [Type actParam](#) (std::set< [Symbol](#) > stop)
 - Parses the individual paramters inside the paramater list when a procedure is called.*
- [Type selec](#) (std::set< [Symbol](#) > stop, [TableEntry](#) entry)
 - Parses whether the varaible being accessed is in a record or expression.*
- [Type fieldSelec](#) (std::set< [Symbol](#) > stop, [TableEntry](#) entry)
 - Parses field/variable being selected from a record.*

Private Attributes

- [Administration & admin](#)
 - The administration object for errors and holding the scanner and symbol table.*
- [Token look](#)
 - The look ahead token.*
- [BlockTable blocks](#)

3.3.1 Constructor & Destructor Documentation

3.3.1.1 Parser::Parser ([Administration & admin](#))

Creates a new [Parser](#) object.

Parameters

admin	An administration object for handling errors and holding our scanner etc. for now.
-----------------------	--

3.3.2 Member Function Documentation

3.3.2.1 Type Parser::actParam (std::set< [Symbol](#) > stop) [private]

Parses the individual paramters inside the paramater list when a procedure is called.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

3.3.2.2 `std::vector<Type> Parser::actParamList (std::set< Symbol > stop)` [private]

Parses the list of parameters when a procedure is being called.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

3.3.2.3 `void Parser::addOp (std::set< Symbol > stop)` [private]

Parses a plus or minus operator from the stream of tokens.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

3.3.2.4 `void Parser::assignStmt (std::set< Symbol > stop)` [private]

Parses an assignment statement.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

3.3.2.5 `void Parser::block (std::set< Symbol > stop, std::vector< TableEntry > entries = std::vector< TableEntry >())` [private]

Parses a block from the stream of tokens.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
<i>entries</i>	The entries being added to the block

3.3.2.6 `void Parser::boolSym (std::set< Symbol > stop)` [private]

Parses a true or false from the stream of tokens.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

3.3.2.7 `Type Parser::constant (std::set< Symbol > stop)` [private]

Parses a const non-terminal.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

3.3.2.8 void Parser::constDef (std::set< Symbol > stop) [private]

Parses a constant definitions from the stream of tokens.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

3.3.2.9 Type Parser::cPrime (std::set< Symbol > stop) [private]

Parses a const num non-terminal.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

3.3.2.10 void Parser::def (std::set< Symbol > stop) [private]

Parses a definition from the stream of tokens.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

3.3.2.11 void Parser::defPart (std::set< Symbol > stop) [private]

Parses a definition part from the stream of tokens.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

3.3.2.12 void Parser::doStmt (std::set< Symbol > stop) [private]

Parses a do statement.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

3.3.2.13 void Parser::emptyStmt (std::set< Symbol > stop) [private]

Parses an empty statement.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

3.3.2.14 Type Parser::expr (std::set< Symbol > stop) [private]

Parses a expression from the stream of tokens.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

3.3.2.15 `std::vector<Type> Parser::exprList (std::set< Symbol > stop)` [private]

Parses a expression list from the stream of tokens.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

3.3.2.16 `Type Parser::factor (std::set< Symbol > stop)` [private]

Parses a factor from the stream of tokens.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

3.3.2.17 `void Parser::fieldList (std::set< Symbol > stop, std::vector< TableEntry > & fields)` [private]

Parses the a list of all the fields and their corresponding types declared.

in a record.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
<i>fields</i>	The field of the record being declared.

3.3.2.18 `Type Parser::fieldSelec (std::set< Symbol > stop, TableEntry entry)` [private]

Parses field/variable being selected from a record.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
<i>entry</i>	The table entry of the record being accessed.

3.3.2.19 `void Parser::formParamList (std::set< Symbol > stop, std::vector< TableEntry > & params)` [private]

Parses the parameter list when a procedure is being declared.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
<i>params</i>	The parameters of the procedure being defined.

3.3.2.20 `void Parser::guardedComm (std::set< Symbol > stop)` [private]

Parses a guarded command.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

3.3.2.21 void Parser::guardedList (std::set< Symbol > *stop*) [private]

Parses a list of guarded commands.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

3.3.2.22 Type Parser::idxSelect (std::set< Symbol > *stop*, TableEntry *entry*) [private]

Parses an index selector.

ie) A[i].

Parameters

<i>stop</i>	The stopsets used to recover from an error.
<i>entry</i>	The Table entry being created

3.3.2.23 void Parser::ifStmt (std::set< Symbol > *stop*) [private]

Parses an if statement.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

3.3.2.24 void Parser::match (Symbol *symbol*, std::set< Symbol > *stop*) [private]

Match a [Token](#) and move to the next one.

Parameters

<i>symbol</i>	The symbol being matched
<i>stop</i>	The stopsets used to recover from the error.

3.3.2.25 void Parser::multOp (std::set< Symbol > *stop*) [private]

Parses a multiplication or division or modulus operator from the stream of tokens.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

3.3.2.26 void Parser::paramDef (std::set< Symbol > *stop*, std::vector< TableEntry > & *params*) [private]

Parses a list of identifiers being passed into the procedure, can be tagged with "var" meaning it is pass by reference, pass by value otherwise.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
<i>params</i>	The parameters of the procedure being defined.

3.3.2.27 void Parser::parse ()

Parses a PL program.

3.3.2.28 Type Parser::primeExpr (std::set< Symbol > stop) [private]

Parses a primary expression from the stream of tokens.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

3.3.2.29 void Parser::primeOp (std::set< Symbol > stop) [private]

Parses a primary operator from the stream of tokens.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

3.3.2.30 void Parser::procBlock (std::set< Symbol > stop, int id) [private]

Parses the block for a procedure declaration.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
<i>id</i>	The id of the procedure.

3.3.2.31 void Parser::procDef (std::set< Symbol > stop) [private]

Parses a procedure definition from the stream of tokens.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

3.3.2.32 void Parser::procStmt (std::set< Symbol > stop) [private]

Parses a procedure call.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

3.3.2.33 void Parser::program (std::set< Symbol > stop) [private]

Parses a program from the stream of tokens.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

3.3.2.34 void Parser::readStmt (std::set< Symbol > *stop*) [private]

Parses a read statement.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

3.3.2.35 void Parser::recordSection (std::set< Symbol > *stop*, std::vector< TableEntry > & *fields*) [private]

Parses a list of identifiers of the same type declared in a record.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
<i>fields</i>	The field of the record being declared.

3.3.2.36 void Parser::relOp (std::set< Symbol > *stop*) [private]

Parses a relational operator from the stream of tokens.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

3.3.2.37 Type Parser::selec (std::set< Symbol > *stop*, TableEntry *entry*) [private]

Parses whether the variable being accessed is in a record or expression.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
<i>entry</i>	The table entry of the record being accessed.

3.3.2.38 Type Parser::simpleExpr (std::set< Symbol > *stop*) [private]

Parses a simple expression from the stream of tokens.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

3.3.2.39 void Parser::stmt (std::set< Symbol > *stop*) [private]

Parses a statement.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

3.3.2.40 void Parser::stmtPart (std::set< Symbol > *stop*) [private]

Parses the statement part of the program.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

3.3.2.41 void Parser::syntaxCheck (std::set< Symbol > *stop*) [private]

Checks the next token to see if it will be valid.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

3.3.2.42 void Parser::syntaxError (std::set< Symbol > *stop*) [private]

Process a syntax error and perform error recovery.

Parameters

<i>stop</i>	The stopsets used to recover from the error.
-------------	--

3.3.2.43 Type Parser::term (std::set< Symbol > *stop*) [private]

Parses a term from the stream of tokens.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

3.3.2.44 Type Parser::typeSym (std::set< Symbol > *stop*) [private]

Parses a definition type from the stream of tokens.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

3.3.2.45 std::vector<Type> Parser::vacList (std::set< Symbol > *stop*) [private]

Parses a variable access list.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

3.3.2.46 Type Parser::varAccess (std::set< Symbol > *stop*) [private]

Parses variable access.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

3.3.2.47 void Parser::varDef (std::set< Symbol > stop) [private]

Parses a variable definition from the stream of tokens.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

3.3.2.48 std::vector<int> Parser::varList (std::set< Symbol > stop) [private]

Parses a variable list from the stream of tokens.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

3.3.2.49 void Parser::vPrime (std::set< Symbol > stop, Type type) [private]

Parses a variable vs array from the stream of tokens.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
<i>type</i>	The type of the table entry that is being created

3.3.2.50 void Parser::writeStmt (std::set< Symbol > stop) [private]

Parses a write statement.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

3.3.3 Member Data Documentation**3.3.3.1 Administration& Parser::admin [private]**

The administration object for errors and holding the scanner and symbol table.

3.3.3.2 BlockTable Parser::blocks [private]**3.3.3.3 Token Parser::look [private]**

The look ahead token.

The documentation for this class was generated from the following file:

- [Parser.h](#)

3.4 Scanner Class Reference

```
#include <Scanner.h>
```

Public Member Functions

- [Scanner](#) (std::istream &ifs, [SymbolTable](#) &symTab)
Constructor for the scanner, initializes the private variables to appropriate values.
- [~Scanner](#) ()
Destructor of the scanner.
- [Token getToken](#) ()
Get the next [Token](#) in the line.

Private Member Functions

- bool [isWhitespace](#) (char inchar)
Checks the input symbol against Whitespace whether tab or space.
- bool [isSpecial](#) (char inchar)
Checks the input char against all possible symbols.
- [Token recognizeName](#) ()
Read and generate tokens for keywords and ID's, also checks for invalid characters and returns a CHAR_ERR token and checks the symbol table is filled then return a FULL_TAB error token.
- [Token recognizeSpecial](#) ()
Read and generate a token for any of the special symbols.
- [Token recognizeNumeral](#) ()
Read and generate a token for any number/digit.

Private Attributes

- std::istream & [fin](#)
The file stream.
- [SymbolTable](#) & [symTab](#)
The symbol table.
- std::string [line](#)
The current line the scanner is reading.
- std::size_t [pos](#)
The position of the char the scanner is reading.

3.4.1 Constructor & Destructor Documentation

3.4.1.1 Scanner::Scanner (std::istream & ifs, SymbolTable & symTab)

Constructor for the scanner, initializes the private variables to appropriate values.

Parameters

<i>ifs</i>	The file stream.
------------	------------------

<i>symTab</i>	The symbol table
---------------	------------------

3.4.1.2 Scanner::~Scanner() [inline]

Destructor of the scanner.

3.4.2 Member Function Documentation

3.4.2.1 Token Scanner::getToken()

Get the next [Token](#) in the line.

3.4.2.2 bool Scanner::isSpecial(char inchar) [private]

Checks the input char against all possible symbols.

Parameters

<i>inchar</i>	The current char being read in
---------------	--------------------------------

Returns

true if the char is a special symbol, false otherwise.

3.4.2.3 bool Scanner::isWhitespace(char inchar) [private]

Checks the input symbol against Whitespace whether tab or space.

Parameters

<i>inchar</i>	The current char being read in
---------------	--------------------------------

Returns

true if the char is whitespace, false otherwise.

3.4.2.4 Token Scanner::recognizeName() [private]

Read and generate tokens for keywords and ID's, also checks for invalid characters and returns a CHAR_ERR token and checks the symbol table is filled then return a FULL_TAB error token.

Returns

An ID or keyword token for the scanned lexeme, or an error token.

3.4.2.5 Token Scanner::recognizeNumeral() [private]

Read and generate a token for any number/digit.

Returns

a token for the number with the actual value in it.

3.4.2.6 Token Scanner::recognizeSpecial () [private]

Read and generate a token for any of the special symbols.

Returns

a token for the special symbol scanned.

3.4.3 Member Data Documentation

3.4.3.1 std::istream& Scanner::fin [private]

The file stream.

3.4.3.2 std::string Scanner::line [private]

The current line the scanner is reading.

3.4.3.3 std::size_t Scanner::pos [private]

The position of the char the scanner is reading.

3.4.3.4 SymbolTable& Scanner::symTab [private]

The symbol table.

The documentation for this class was generated from the following file:

- [Scanner.h](#)

3.5 SymbolTable Class Reference

```
#include <SymbolTable.h>
```

Public Member Functions

- [SymbolTable](#) ()
- int [search](#) (const std::string &str)
Searches for a lexeme in the symbol table and returns its token.
- int [insert](#) (const std::string &str)
Inserts a new lexeme into the symbol table if it is not already there.
- [Token](#) & [getToken](#) (int idx, bool &found)
Get a reference to the token in the symbol table by its index.
- int [hash](#) (const std::string &str)
Computes a rolling hash for a given string using the MOD constant.
- bool [full](#) ()
Returns true if the table is full.
- int [getLoad](#) ()
Returns the number items in the table.
- std::string [toString](#) ()
Returns a string representation of the table.

Private Member Functions

- `std::pair< int, Token & > probe (int idx, std::string lexeme)`
Given a position linear probe until the token with the given lexeme is found or an empty token is found.
- `void loadKey (Symbol sym, const std::string &lexeme)`
Load a token for a reserved keyword into the table.
- `void loadKeywords ()`
Loads all reserved keywords into the symbol table.

Private Attributes

- `std::vector< Token > table`
Backing array for the hash table.
- `int load`
The number of elements in the hash table.

3.5.1 Constructor & Destructor Documentation

3.5.1.1 SymbolTable::SymbolTable ()

3.5.2 Member Function Documentation

3.5.2.1 bool SymbolTable::full ()

Returns true if the table is full.

3.5.2.2 int SymbolTable::getLoad ()

Returns the number items in the table.

3.5.2.3 Token& SymbolTable::getToken (int idx, bool & found)

Get a reference to the token in the symbol table by its index.

Parameters

<i>idx</i>	The index of the token.
<i>found</i>	

Returns

a reference to the token or a dummy empty token.

Exceptions

<i>out_of_range</i>	error if the idx is out of bounds.
---------------------	------------------------------------

3.5.2.4 int SymbolTable::hash (const std::string & str)

Computes a rolling hash for a given string using the MOD constant.

Only looks at a max of 10 characters from the string.

Parameters

<i>str</i>	The string to hash.
------------	---------------------

Returns

the integer hash value of the string.

3.5.2.5 int SymbolTable::insert (const std::string & *str*)

Inserts a new lexeme into the symbol table if it is not already there.

Parameters

<i>str</i>	Insert a string into the hash table.
------------	--------------------------------------

Returns

The index of the token in the symbol table, or -1 if it exists.

Exceptions

<i>length_error</i>	if the symbol table is full.
---------------------	------------------------------

3.5.2.6 void SymbolTable::loadKey (Symbol *sym*, const std::string & *lexeme*) [private]

Load a token for a reserved keyword into the table.

Parameters

<i>lexeme</i>	The tokens's lexeme.
<i>sym</i>	The token's symbol.

3.5.2.7 void SymbolTable::loadKeywords () [private]

Loads all reserved keywords into the symbol table.

3.5.2.8 std::pair<int, Token&> SymbolTable::probe (int *idx*, std::string *lexeme*) [private]

Given a position linear probe until the token with the given lexeme is found or an empty token is found.

Parameters

<i>idx</i>	The initial position to start probing. Generally the lexemes hash value.
<i>lexeme</i>	The lexeme to probe for.

Returns

a pair with the position of the token and the lexeme.

3.5.2.9 int SymbolTable::search (const std::string & *str*)

Searches for a lexeme in the symbol table and returns its token.

Parameters

<i>str</i>	The lexeme to search for.
------------	---------------------------

Returns

The index of the token in the symbol table, or -1 for not found.

3.5.2.10 `std::string SymbolTable::toString ()`

Returns a string representation of the table.

3.5.3 Member Data Documentation

3.5.3.1 `int SymbolTable::load` [private]

The number of elements in the hash table.

3.5.3.2 `std::vector<Token> SymbolTable::table` [private]

Backing array for the hash table.

The documentation for this class was generated from the following file:

- [SymbolTable.h](#)

3.6 TableEntry Class Reference

```
#include <TableEntry.h>
```

Public Member Functions

- [TableEntry](#) ()
Default Constructor that creates a empty table entry set to default values.
- [TableEntry](#) (int nid, [Kind](#) nkind, [Type](#) ntype, int nsize, int nval)
Overloaded constructor that creates the table entry with the input values.
- int [findEntry](#) ([TableEntry](#) &entry)
Check if the table entry input is a param or field of a procedure or record.
- int [findEntry](#) (int id)
Overloaded function to check if a table entry is a param or field using its id of a procedure or record.

Public Attributes

- int [id](#)
The table entry id.
- [Kind](#) [tkind](#)
The kind of table entry.
- [Type](#) [ttype](#)
The type of the table entry.
- int [size](#)

The size of the required memory for the table entry.

- int `val`

The value of the table entry.

- `std::vector< TableEntry > entries`

The field/params of a record/procedure respectively.

3.6.1 Constructor & Destructor Documentation

3.6.1.1 `TableEntry::TableEntry ()` `[inline]`

Default Constructor that creates a empty table entry set to default values.

3.6.1.2 `TableEntry::TableEntry (int nid, Kind nkind, Type ntype, int nsize, int nval)` `[inline]`

Overloaded constructor that creates the table entry with the input values.

Parameters

<i>nid</i>	The id of the table entry
<i>nkind</i>	The Kind of the table entry
<i>ntype</i>	The Type of the table entry
<i>nsize</i>	The memory size required by the table entry
<i>nval</i>	The value of the table entry

3.6.2 Member Function Documentation

3.6.2.1 `int TableEntry::findEntry (TableEntry & entry)` `[inline]`

Check if the table entry input is a param or field of a procedure or record.

Parameters

<i>entry</i>	The table entry being searched for
--------------	------------------------------------

3.6.2.2 `int TableEntry::findEntry (int id)` `[inline]`

Overloaded function to check if a table entry is a param or field using its id of a procedure or record.

Parameters

<i>The</i>	id of the table entry being searched for
------------	--

3.6.3 Member Data Documentation

3.6.3.1 `std::vector<TableEntry> TableEntry::entries`

The field/params of a record/procedure respectively.

3.6.3.2 `int TableEntry::id`

The table entry id.

3.6.3.3 `int TableEntry::size`

The size of the required memory for the table entry.

3.6.3.4 `Kind TableEntry::tkind`

The kind of table entry.

3.6.3.5 `Type TableEntry::ttype`

The type of the table entry.

3.6.3.6 `int TableEntry::val`

The value of the table entry.

The documentation for this class was generated from the following file:

- [TableEntry.h](#)

3.7 Token Class Reference

```
#include <Token.h>
```

Public Member Functions

- [Token](#) ()
Creates a new default token.
- [Token](#) ([Symbol](#) sym, std::string [lexeme](#)="", int [val](#)=-1)
Creates a new token.
- [Token](#) (const [Token](#) &tok)
Copy Constructor.
- [Symbol](#) [getSymbol](#) () const
Returns the symbol.
- std::string [getLexeme](#) () const
Returns the lexeme.
- int [getVal](#) () const
Returns the value.
- void [setSymbol](#) ([Symbol](#) sym)
Sets the symbol.
- void [setLexeme](#) (std::string [lexeme](#))
Sets the lexeme.
- void [setVal](#) (int [val](#))
Sets the value.
- std::string [toString](#) ()
Returns a string representation of the [Token](#).

Private Attributes

- [Symbol *sname*](#)
The token's symbol.
- `std::string` [lexeme](#)
The tokens lexeme.
- `int` [val](#)
The numeric value of the token.

3.7.1 Constructor & Destructor Documentation

3.7.1.1 `Token::Token ()`

Creates a new default token.

Sets Symbol to EMPTY, lexeme to "", and value to -1.

3.7.1.2 `Token::Token (Symbol sym, std::string lexeme = " ", int val = -1)`

Creates a new token.

Parameters

<i>sym</i>	The symbol for the token.
<i>lexeme</i>	The lexeme for the token. Default "".
<i>val</i>	The numerical value to give to the token. Default -1.

3.7.1.3 `Token::Token (const Token & tok)`

Copy Constructor.

3.7.2 Member Function Documentation

3.7.2.1 `std::string Token::getLexeme () const`

Returns the lexeme.

3.7.2.2 `Symbol Token::getSymbol () const`

Returns the symbol.

3.7.2.3 `int Token::getVal () const`

Returns the value.

3.7.2.4 `void Token::setLexeme (std::string lexeme)`

Sets the lexeme.

Parameters

<i>lexeme</i>	The lexeme to give the token.
---------------	-------------------------------

3.7.2.5 void Token::setSymbol (Symbol sym)

Sets the symbol.

Parameters

<i>sym</i>	The symbol to give the token.
------------	-------------------------------

3.7.2.6 void Token::setVal (int val)

Sets the value.

Parameters

<i>val</i>	The value to give the token.
------------	------------------------------

3.7.2.7 std::string Token::toString ()

Returns a string representation of the [Token](#).

3.7.3 Member Data Documentation**3.7.3.1 std::string Token::lexeme** `[private]`

The tokens lexeme.

3.7.3.2 Symbol Token::sname `[private]`

The token's symbol.

3.7.3.3 int Token::val `[private]`

The numeric value of the token.

4.3.2 Function Documentation

4.3.2.1 `bool in (std::set< Symbol > S, Symbol sym)`

Check if a symbol is in a set.

Helper for checking stop set membership.

Parameters

<code>S</code>	The symbol set to check.
<code>sym</code>	The symbol to check.

Returns

true if sym is in S.

4.3.2.2 `std::set<Symbol> munion (std::vector< std::set< Symbol >> stopSets)`

Union a vector of stopsets together.

Parameters

<code>stopSets</code>	A vector of Symbol sets to union.
-----------------------	-----------------------------------

Returns

a set of all of the given stopsets.

4.3.3 Variable Documentation

4.3.3.1 `const std::map<NT, std::set<Symbol> > First`

Map from non terminals to thier first sets of symbols.

CHAR_ERR

4.6.2 Variable Documentation

4.6.2.1 `const std::map<std::string, Symbol> SpecialSym`

Initial value:

```
{
  { ".", Symbol::DOT },
  { ",", Symbol::COMMA },
  { ";", Symbol::SEMI },
  { "[", Symbol::LHSQR },
  { "]", Symbol::RHSQR },
  { "&", Symbol::AMP },
  { "|", Symbol::BAR },
  { "~", Symbol::TILD },
  { "<", Symbol::LESS },
  { "=", Symbol::EQUAL },
  { ">", Symbol::GREAT },
  { "+", Symbol::PLUS },
  { "-", Symbol::MINUS },
  { "*", Symbol::TIMES },
  { "/", Symbol::FSLASH },
  { "\\ ", Symbol::BSLASH },
  { "(", Symbol::LHRND },
  { ")", Symbol::RHRND },
  { ":", Symbol::INIT },
  { "[ ]", Symbol::GUARD },
  { "->", Symbol::ARROW }
}
```

Map for all special lexemes to their symbol.

4.6.2.2 `const std::map<Symbol, std::string> SymbolToString`

Map from all symbols to string versions of themselves for printing.

4.6.2.3 `const std::map<std::string, Symbol> WordSym`

Initial value:

```
{
  { "begin", Symbol::BEGIN },
  { "end", Symbol::END },
  { "const", Symbol::CONST },
  { "array", Symbol::ARRAY },
  { "proc", Symbol::PROC },
  { "skip", Symbol::SKIP },
  { "read", Symbol::READ },
  { "write", Symbol::WRITE },
  { "call", Symbol::CALL },
  { "if", Symbol::IF },
  { "fi", Symbol::FI },
  { "do", Symbol::DO },
  { "od", Symbol::OD },
  { "integer", Symbol::INT },
  { "Boolean", Symbol::BOOL },
  { "true", Symbol::TRUE },
  { "false", Symbol::FALSE },
  { "record", Symbol::RECORD },
  { "var", Symbol::VAR },
  { "float", Symbol::FLOAT }
}
```

Map for all keywords (word symbols) to their symbol.

4.7 SymbolTable.h File Reference

```
#include "Token.h"  
#include <vector>  
#include <string>
```

Classes

- class [SymbolTable](#)

Variables

- const int [MOD](#) = 307
- const int [PRIME](#) = 67
- const int [ID_MAX_CHARS](#) = 10

4.7.1 Variable Documentation

4.7.1.1 [const int ID_MAX_CHARS](#) = 10

4.7.1.2 [const int MOD](#) = 307

4.7.1.3 [const int PRIME](#) = 67

4.8 TableEntry.h File Reference

```
#include <vector>  
#include "Types.h"
```

Classes

- class [TableEntry](#)

4.9 Token.h File Reference

```
#include "Symbol.h"  
#include <iostream>  
#include <string>
```

Classes

- class [Token](#)

4.10 Types.h File Reference

Enumerations

- enum [Kind](#) {
[CONSTANT](#) =500, [VARIABLE](#), [K_ARRAY](#), [PROCEDURE](#),
[UNDEFINED](#), [K_RECORD](#) }
Enum containing all the kinds of table entries.
- enum [Type](#) { [INTEGER](#) =600, [BOOLEAN](#), [UNIVERSAL](#), [T_FLOAT](#) }
Enum containing all the Types of table entries.

Variables

- const std::map< [Kind](#), std::string > [KindToString](#)
Mapping the Kinds to strings representing the kinds.
- const std::map< [Type](#), std::string > [TypeToString](#)
Mapping the Type to strings representing the types.

4.10.1 Enumeration Type Documentation

4.10.1.1 enum Kind

Enum containing all the kinds of table entries.

Enumerator

CONSTANT
VARIABLE
K_ARRAY
PROCEDURE
UNDEFINED
K_RECORD

4.10.1.2 enum Type

Enum containing all the Types of table entries.

Enumerator

INTEGER
BOOLEAN
UNIVERSAL
T_FLOAT

4.10.2 Variable Documentation

4.10.2.1 const std::map<Kind, std::string> KindToString

Initial value:

```
{
  {CONSTANT, "'Constant'"},
  {VARIABLE, "'Variable'"},
  {K_ARRAY, "'Array'"},
  {PROCEDURE, "'Procedure'"},
  {UNDEFINED, "'Undefined'"},
  {K_RECORD, "'Record'"}
}
```

Mapping the Kinds to strings representing the kinds.

4.10.2.2 `const std::map<Type, std::string> TypeToString`

Initial value:

```
{
  {INTEGER, "'Integer'"},
  {BOOLEAN, "'Boolean'"},
  {UNIVERSAL, "'Universal'"},
  {T_FLOAT, "'Float'"}
}
```

Mapping the Type to strings representing the types.
