Chapter 1

Class Index

1.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

Administration	5
Assembler	9
BlockTable	11
Parser	14
Scanner	35
SymbolTable	38
TableEntry	43
Token	46

Chapter 2

File Index

2.1 File List

Here is a list of all files with brief descriptions:

Administration.h	51
Assembler.h	51
BlockTable.h	52
Grammar.h	53
Parser.h	56
Scanner.h	56
Symbol.h	56
SymbolTable.h	59
TableEntry.h	60
Token.h	60
Types.h	61

Chapter 3

Class Documentation

3.1 Administration Class Reference

```
#include <Administration.h>
```

Public Member Functions

- [Administration](#) (std::ostream &fout, [Scanner](#) &sc, bool debug=false)
Creates a new [Administration](#) object.
- int [currentLine](#) ()
Returns the current line number.
- [Token](#) [getToken](#) ()
Get a new token from the scanner.
- void [newLine](#) ()
Adds line number and resets correctLine.
- void [debugInfo](#) (std::string text)
Print debugging info to the console if in debug mode.
- void [error](#) (std::string text)
Display text for an error.
- void [emit](#) (std::string text, int var=-1, int start=-1)
Emit assembly code to the output file.
- int [error_count](#) ()
Return the number of errors.

Private Member Functions

- void [checkError](#) ([Token](#) ntoken)
Checks if current token is an error token.

Private Attributes

- `std::ostream & fout`
File to print all tokens to.
- `Scanner & scanner`
The scanner to use on the input.
- `int lineNum`
The current line number.
- `bool correctLine`
True if the line has no errors so far.
- `int errorCount`
The total number of errors so far.
- `bool debug`
Wether or not to print debugging info.

3.1.1 Constructor & Destructor Documentation

3.1.1.1 Administration()

```
Administration::Administration (
    std::ostream & fout,
    Scanner & sc,
    bool debug = false )
```

Creates a new `Administration` object.

Parameters

<i>fout</i>	The output file stream.
<i>sc</i>	The scanner beign used by administration.
<i>debug</i>	Set debug mode. Default false.

3.1.2 Member Function Documentation

3.1.2.1 checkError()

```
void Administration::checkError (
    Token ntoken ) [private]
```

Checks if current token is an error token.

Parameters

<i>ntoken</i>	The current token.
---------------	--------------------

3.1.2.2 `currentLine()`

```
int Administration::currentLine ( ) [inline]
```

Returns the current line number.

3.1.2.3 `debugInfo()`

```
void Administration::debugInfo (
    std::string text )
```

Print debugging info to the console if in debug mode.

Parameters

<i>text</i>	The info to print.
-------------	--------------------

3.1.2.4 `emit()`

```
void Administration::emit (
    std::string text,
    int var = -1,
    int start = -1 )
```

Emit assembly code to the output file.

3.1.2.5 `error()`

```
void Administration::error (
    std::string text )
```

Display text for an error.

Parameters

<i>text</i>	The error message.
-------------	--------------------

3.1.2.6 error_count()

```
int Administration::error_count ( ) [inline]
```

Return the number of errors.

3.1.2.7 getToken()

```
Token Administration::getToken ( )
```

Get a new token from the scanner.

Returns

The next scanned token.

3.1.2.8 newLine()

```
void Administration::newLine ( )
```

Adds line number and resets correctLine.

3.1.3 Member Data Documentation

3.1.3.1 correctLine

```
bool Administration::correctLine [private]
```

True if the line has no errors so far.

3.1.3.2 debug

```
bool Administration::debug [private]
```

Wether or not to print debugging info.

3.1.3.3 errorCount

```
int Administration::errorCount [private]
```

The total number of errors so far.

3.1.3.4 fout

```
std::ostream& Administration::fout [private]
```

File to print all tokens to.

3.1.3.5 lineNum

```
int Administration::lineNum [private]
```

The current line number.

3.1.3.6 scanner

```
Scanner& Administration::scanner [private]
```

The scanner to use on the input.

The documentation for this class was generated from the following file:

- [Administration.h](#)

3.2 Assembler Class Reference

```
#include <Assembler.h>
```

Public Member Functions

- [Assembler](#) (istream &[in](#), ostream &out)
- [~Assembler](#) ()
- void [firstPass](#) ()
- void [secondPass](#) ()

Private Attributes

- int [labelTable](#) [[MAXLABEL](#)]
- int [currentAddress](#)
- istream * [insource](#)
- ostream * [outsource](#)

3.2.1 Constructor & Destructor Documentation

3.2.1.1 Assembler()

```
Assembler::Assembler (
    istream & in,
    ostream & out )
```

3.2.1.2 ~Assembler()

```
Assembler::~~Assembler ( )
```

3.2.2 Member Function Documentation

3.2.2.1 firstPass()

```
void Assembler::firstPass ( )
```

3.2.2.2 secondPass()

```
void Assembler::secondPass ( )
```

3.2.3 Member Data Documentation

3.2.3.1 currentAddress

```
int Assembler::currentAddress [private]
```

3.2.3.2 insource

```
istream* Assembler::insource [private]
```

3.2.3.3 labelTable

```
int Assembler::labelTable[MAXLABEL] [private]
```

3.2.3.4 outsource

```
ostream* Assembler::outsourc [private]
```

The documentation for this class was generated from the following file:

- [Assembler.h](#)

3.3 BlockTable Class Reference

```
#include <BlockTable.h>
```

Public Member Functions

- [BlockTable](#) ()
Default Constructor for a [BlockTable](#).
- bool [search](#) (int lookId)
Searches the current level of the blocktable for a table entry.
- bool [define](#) (int nid, [Kind](#) nkind, [Type](#) ntype, int nsize, int nval, int displace)
Creates a new table entry and puts it into the current block if it doesnt already exist.
- bool [define](#) ([TableEntry](#) &entry)
Overloaded define function that takes in a table entry to define.
- [TableEntry](#) [find](#) (int lookId, bool &error)
Searches the entire blocktable for the table entry.
- bool [pushBlock](#) ()
Creates and pushes a new blocktable onto the current block.
- void [popBlock](#) ()
Removes the highest level (most recent) block of the blocktable.
- int [level](#) ()
The current block level.

Private Attributes

- `std::vector< std::map< int, TableEntry > > table`
Vector of maps storing the table entries for a block (the block table)
- `int blockLevel`
The current blocklevel.

3.3.1 Constructor & Destructor Documentation

3.3.1.1 [BlockTable\(\)](#)

```
BlockTable::BlockTable ( )
```

Default Constructor for a [BlockTable](#).

3.3.2 Member Function Documentation

3.3.2.1 [define\(\)](#) [1/2]

```
bool BlockTable::define (
    int nid,
    Kind nkind,
    Type ntype,
    int nsiz,
    int nval,
    int displace )
```

Creates a new table entry and puts it into the current block if it doesnt already exist.

Parameters

<i>nid</i>	The id of the table entry
<i>nkind</i>	The kind of the table entry
<i>ntype</i>	The type of the table entry
<i>nsiz</i>	The memory size required by the table entry
<i>nval</i>	The value of the table entry
<i>displace</i>	The displacement from the start label

3.3.2.2 [define\(\)](#) [2/2]

```
bool BlockTable::define (
```

```
TableEntry & entry )
```

Overloaded define function that takes in a table entry to define.

Parameters

<i>entry</i>	The table entry that will be define
--------------	-------------------------------------

3.3.2.3 find()

```
TableEntry BlockTable::find (
    int lookId,
    bool & error )
```

Searches the entire blocktable for the table entry.

Parameters

<i>lookId</i>	The id of the table entry being searched for
<i>error</i>	The error check for when the table entry does not exist

3.3.2.4 level()

```
int BlockTable::level ( ) [inline]
```

The current block level.

3.3.2.5 popBlock()

```
void BlockTable::popBlock ( )
```

Removes the highest level (most recent) block of the blocktable.

3.3.2.6 pushBlock()

```
bool BlockTable::pushBlock ( )
```

Creates and pushes a new blocktable onto the current block.

3.3.2.7 search()

```
bool BlockTable::search (
    int lookId )
```

Searches the current level of the blocktable for a table entry.

Parameters

<i>lookID</i>	The id of the table entry being searched for
---------------	--

3.3.3 Member Data Documentation

3.3.3.1 blockLevel

```
int BlockTable::blockLevel [private]
```

The current blocklevel.

3.3.3.2 table

```
std::vector<std::map<int, TableEntry> > BlockTable::table [private]
```

Vector of maps storing the table entries for a block (the block table)

The documentation for this class was generated from the following file:

- [BlockTable.h](#)

3.4 Parser Class Reference

```
#include <Parser.h>
```

Public Member Functions

- [Parser](#) ([Administration](#) &admin)
Creates a new [Parser](#) object.
- void [parse](#) ()
Parses a PL program.

Private Member Functions

- int [NewLabel](#) ()
Returns a numerical label that is incremented on each use.
- void [match](#) ([Symbol](#) symbol, std::set< [Symbol](#) > stop)
Match a [Token](#) and move to the next one.
- void [syntaxError](#) (std::set< [Symbol](#) > stop)
Process a syntax error and perform error recovery.
- void [syntaxCheck](#) (std::set< [Symbol](#) > stop)
Checks the next token to see if it will be valid.
- void [program](#) (std::set< [Symbol](#) > stop)
Parses a program from the stream of tokens.
- void [block](#) (std::set< [Symbol](#) > stop, std::vector< [TableEntry](#) > entries, int startlabel, int varlabel)
Parses a block from the stream of tokens.
- int [defPart](#) (std::set< [Symbol](#) > stop)
Parses a definition part from the stream of tokens.
- int [def](#) (std::set< [Symbol](#) > stop, int &start)
Parses a definition from the stream of tokens.
- void [constDef](#) (std::set< [Symbol](#) > stop)
Parses a constant definitions from the stream of tokens.
- void [procDef](#) (std::set< [Symbol](#) > stop)
Parses a procedure definition from the stream of tokens.
- void [stmtPart](#) (std::set< [Symbol](#) > stop)
Parses the statement part of the program.
- void [stmt](#) (std::set< [Symbol](#) > stop)
Parses a statement.
- void [emptyStmt](#) (std::set< [Symbol](#) > stop)
Parses an empty statement.
- void [readStmt](#) (std::set< [Symbol](#) > stop)
Parses a read statement.
- void [writeStmt](#) (std::set< [Symbol](#) > stop)
Parses a write statement.
- void [assignStmt](#) (std::set< [Symbol](#) > stop)
Parses an assignment statement.
- void [procStmt](#) (std::set< [Symbol](#) > stop)
Parses a procedure call.
- void [ifStmt](#) (std::set< [Symbol](#) > stop)
Parses an if statement.
- void [doStmt](#) (std::set< [Symbol](#) > stop)
Parses a do statement.
- std::vector< [Type](#) > [vacsList](#) (std::set< [Symbol](#) > stop)
Parses a variable access list.
- [Type](#) [varAccess](#) (std::set< [Symbol](#) > stop, bool &isConst)
Parses variable access.
- int [varDef](#) (std::set< [Symbol](#) > stop, int &start)
Parses a variable definition from the stream of tokens.
- int [vPrime](#) (std::set< [Symbol](#) > stop, [Type](#) type, int &start)
Parses a variable vs array from the stream of tokens.
- std::vector< int > [varList](#) (std::set< [Symbol](#) > stop)
Parses a variable list from the stream of tokens.
- [Type](#) [idxSelect](#) (std::set< [Symbol](#) > stop, [TableEntry](#) entry)

- Parses an index selector.*
 - `std::vector< Type > exprList (std::set< Symbol > stop)`
- Parses a expression list from the stream of tokens.*
 - `Type expr (std::set< Symbol > stop)`
- Parses a expression from the stream of tokens.*
 - `Type primeExpr (std::set< Symbol > stop)`
- Parses a primary expression from the stream of tokens.*
 - `Type simpleExpr (std::set< Symbol > stop)`
- Parses a simple expression from the stream of tokens.*
 - `void guardedList (std::set< Symbol > stop, int &start, int next)`
- Parses a list of guarded commands.*
 - `void guardedComm (std::set< Symbol > stop, int &start, int next)`
- Parses a guarded command.*
 - `Type term (std::set< Symbol > stop)`
- Parses a term from the stream of tokens.*
 - `Type factor (std::set< Symbol > stop)`
- Parses a factor from the stream of tokens.*
 - `std::string primeOp (std::set< Symbol > stop)`
- Parses a primary operator from the stream of tokens.*
 - `std::string relOp (std::set< Symbol > stop)`
- Parses a realtional operator from the stream of tokens.*
 - `std::string addOp (std::set< Symbol > stop)`
- Parses a plus or minus operator from the stream of tokens.*
 - `std::string multOp (std::set< Symbol > stop)`
- Parses a multiplication or division or modulus operator from the stream of tokens.*
 - `std::pair< Type, int > constant (std::set< Symbol > stop)`
- Parses a const non-terminal.*
 - `Type cPrime (std::set< Symbol > stop)`
- Parses a const num non-terminal.*
 - `Type typeSym (std::set< Symbol > stop)`
- Parses a definition type from the stream of tokens.*
 - `int boolSym (std::set< Symbol > stop)`
- Parses a true or false from the stream of tokens.*
 - `void fieldList (std::set< Symbol > stop, std::vector< TableEntry > &fields)`
- Parses the a list of all the fields and their corresponding types declared.*
 - `void recordSection (std::set< Symbol > stop, std::vector< TableEntry > &fields)`
- Parses a list of idetifiers of the same type declared in a record.*
 - `void procBlock (std::set< Symbol > stop, int id, int start, int var, int proc)`
- Parses the block for a procedure declaration.*
 - `void formParamList (std::set< Symbol > stop, std::vector< TableEntry > ¶ms)`
- Parses the parameter list when a procdure is being declared.*
 - `void paramDef (std::set< Symbol > stop, std::vector< TableEntry > ¶ms)`
- Parses a list of idetifiers being passed into the procedure, can be tagged with "var" meaning it is pass by reference, pass by value otherwise.*
 - `std::vector< Type > actParamList (std::set< Symbol > stop)`
- Parses the list of parameters when a procedure is being called.*
 - `Type actParam (std::set< Symbol > stop)`
- Parses the individual paramters inside the paramater list when a procedure is called.*
 - `Type selec (std::set< Symbol > stop, TableEntry entry)`
- Parses whether the varaible being accessed is in a record or expression.*
 - `Type fieldSelec (std::set< Symbol > stop, TableEntry entry)`
- Parses field/variable being selected from a record.*

Private Attributes

- `int label`
- `Administration & admin`
The administration object for errors and holding the scanner and symbol table.
- `Token look`
The look ahead token.
- `BlockTable blocks`
Block table structure that keeps track of variables and their scope.

3.4.1 Constructor & Destructor Documentation

3.4.1.1 Parser()

```
Parser::Parser (
    Administration & admin )
```

Creates a new `Parser` object.

Parameters

<code>admin</code>	An administration object for handling errors and holding our scanner etc. for now.
--------------------	--

3.4.2 Member Function Documentation

3.4.2.1 actParam()

```
Type Parser::actParam (
    std::set< Symbol > stop ) [private]
```

Parses the individual paramters inside the paramater list when a procedure is called.

Parameters

<code>stop</code>	The stopsets used to recover from an error.
-------------------	---

Returns

The type of the parameter.

3.4.2.2 actParamList()

```
std::vector<Type> Parser::actParamList (
    std::set< Symbol > stop ) [private]
```

Parses the list of parameters when a procedure is being called.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

Returns

The types of the parameters in order.

3.4.2.3 addOp()

```
std::string Parser::addOp (
    std::set< Symbol > stop ) [private]
```

Parses a plus or minus operator from the stream of tokens.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

Returns

the psuedo code string for the operator parsed, or ERROR.

3.4.2.4 assignStmt()

```
void Parser::assignStmt (
    std::set< Symbol > stop ) [private]
```

Parses an assignment statement.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

3.4.2.5 block()

```
void Parser::block (
    std::set< Symbol > stop,
    std::vector< TableEntry > entries,
    int startLabel,
    int varLabel ) [private]
```

Parses a block from the stream of tokens.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
<i>entries</i>	The entries being added to the block
<i>startLabel</i>	The current numerical label that this block started at
<i>varLabel</i>	Used to determine the total size of variables in the block (we think).

3.4.2.6 boolSym()

```
int Parser::boolSym (
    std::set< Symbol > stop ) [private]
```

Parses a true or false from the stream of tokens.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

Returns

a number to represent the value parsed 0 = false, 1 = true.

3.4.2.7 constant()

```
std::pair<Type,int> Parser::constant (
    std::set< Symbol > stop ) [private]
```

Parses a const non-terminal.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

Returns

a pair with the type and value of the constant parsed.

3.4.2.8 constDef()

```
void Parser::constDef (
    std::set< Symbol > stop ) [private]
```

Parses a constant definitions from the stream of tokens.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

3.4.2.9 cPrime()

```
Type Parser::cPrime (
    std::set< Symbol > stop ) [private]
```

Parses a const num non-terminal.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

Returns

the type of the non-terminal parsed.

3.4.2.10 def()

```
int Parser::def (
    std::set< Symbol > stop,
    int & start ) [private]
```

Parses a definition from the stream of tokens.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
<i>start</i>	The starting label for variable being defined.

Returns

the size of the variables defined.

3.4.2.11 defPart()

```
int Parser::defPart (
    std::set< Symbol > stop ) [private]
```

Parses a definition part from the stream of tokens.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

Returns

the size of the variables defined.

3.4.2.12 doStmt()

```
void Parser::doStmt (
    std::set< Symbol > stop ) [private]
```

Parses a do statement.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

3.4.2.13 emptyStmt()

```
void Parser::emptyStmt (
    std::set< Symbol > stop ) [private]
```

Parses an empty statement.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

3.4.2.14 `expr()`

```
Type Parser::expr (
    std::set< Symbol > stop ) [private]
```

Parses a expression from the stream of tokens.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

Returns

The type of the expression result.

3.4.2.15 `exprList()`

```
std::vector<Type> Parser::exprList (
    std::set< Symbol > stop ) [private]
```

Parses a expression list from the stream of tokens.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

Returns

The type of each expression result in the list in order.

3.4.2.16 `factor()`

```
Type Parser::factor (
    std::set< Symbol > stop ) [private]
```

Parses a factor from the stream of tokens.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
<i>the</i>	resulting type of the factor.

3.4.2.17 fieldList()

```
void Parser::fieldList (
    std::set< Symbol > stop,
    std::vector< TableEntry > & fields ) [private]
```

Parses the a list of all the fields and their corresponding types declared.

in a record.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
<i>fields</i>	The field of the record being declared.

3.4.2.18 fieldSelec()

```
Type Parser::fieldSelec (
    std::set< Symbol > stop,
    TableEntry entry ) [private]
```

Parses field/variable being selected from a record.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
<i>entry</i>	The table entry of the record being accessed.

Returns

The type of the variable being accessed.

3.4.2.19 formParamList()

```
void Parser::formParamList (
    std::set< Symbol > stop,
    std::vector< TableEntry > & params ) [private]
```

Parses the parameter list when a procedure is being declared.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
<i>params</i>	The parameters of the procedure being defined.

3.4.2.20 guardedComm()

```
void Parser::guardedComm (
    std::set< Symbol > stop,
    int & start,
    int next ) [private]
```

Parses a guarded command.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
<i>start</i>	The current label to be set.
<i>next</i>	A lable used to decide where to jump to after execution.

3.4.2.21 guardedList()

```
void Parser::guardedList (
    std::set< Symbol > stop,
    int & start,
    int next ) [private]
```

Parses a list of guarded commands.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
<i>start</i>	The current label to be set.
<i>next</i>	A lable used to decide where to jump to after execution.

3.4.2.22 idxSelect()

```
Type Parser::idxSelect (
    std::set< Symbol > stop,
    TableEntry entry ) [private]
```

Parses an index selector.

ie) A[i].

Parameters

<i>stop</i>	The stopsets used to recover from an error.
<i>entry</i>	The Table entry being created

Returns

The type of the accessed variable.

3.4.2.23 ifStmt()

```
void Parser::ifStmt (
    std::set< Symbol > stop ) [private]
```

Parses an if statement.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

3.4.2.24 match()

```
void Parser::match (
    Symbol symbol,
    std::set< Symbol > stop ) [private]
```

Match a [Token](#) and move to the next one.

Parameters

<i>symbol</i>	The symbol being matched
<i>stop</i>	The stopsets used to recover from the error.

3.4.2.25 multOp()

```
std::string Parser::multOp (
    std::set< Symbol > stop ) [private]
```

Parses a multiplication or division or modulus operator from the stream of tokens.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

Returns

the psuedo code string for the operator parsed, or ERROR.

3.4.2.26 NewLabel()

```
int Parser::NewLabel ( ) [private]
```

Returns a numerical label that is incremented on each use.

3.4.2.27 paramDef()

```
void Parser::paramDef (
    std::set< Symbol > stop,
    std::vector< TableEntry > & params ) [private]
```

Parses a list of identifiers being passed into the procedure, can be tagged with "var" meaning it is pass by reference, pass by value otherwise.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
<i>params</i>	The parameters of the procedure being defined.

3.4.2.28 parse()

```
void Parser::parse ( )
```

Parses a PL program.

3.4.2.29 primeExpr()

```
Type Parser::primeExpr (
    std::set< Symbol > stop ) [private]
```

Parses a primary expression from the stream of tokens.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

Returns

The type of the expression result.

3.4.2.30 primeOp()

```
std::string Parser::primeOp (
    std::set< Symbol > stop ) [private]
```

Parses a primary operator from the stream of tokens.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

Returns

the psuedo code string for the operator parsed, or ERROR.

3.4.2.31 procBlock()

```
void Parser::procBlock (
    std::set< Symbol > stop,
    int id,
    int start,
    int var,
    int proc ) [private]
```

Parses the block for a procedure declaration.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
<i>id</i>	The id of the procedure.
<i>start</i>	The start label when the block was parsed.
<i>var</i>	The size of the variables in the block.
<i>proc</i>	The label of the procedure.

3.4.2.32 procDef()

```
void Parser::procDef (
    std::set< Symbol > stop ) [private]
```

Parses a procedure definition from the stream of tokens.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

3.4.2.33 procStmt()

```
void Parser::procStmt (
    std::set< Symbol > stop ) [private]
```

Parses a procedure call.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

3.4.2.34 program()

```
void Parser::program (
    std::set< Symbol > stop ) [private]
```

Parses a program from the stream of tokens.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

3.4.2.35 readStmt()

```
void Parser::readStmt (
    std::set< Symbol > stop ) [private]
```

Parses a read statement.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

3.4.2.36 recordSection()

```
void Parser::recordSection (
    std::set< Symbol > stop,
    std::vector< TableEntry > & fields ) [private]
```

Parses a list of identifiers of the same type declared in a record.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
<i>fields</i>	The field of the record being declared.

3.4.2.37 relOp()

```
std::string Parser::relOp (
    std::set< Symbol > stop ) [private]
```

Parses a relational operator from the stream of tokens.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

Returns

the pseudo code string for the operator parsed, or ERROR.

3.4.2.38 selec()

```
Type Parser::selec (
    std::set< Symbol > stop,
    TableEntry entry ) [private]
```

Parses whether the variable being accessed is in a record or expression.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
<i>entry</i>	The table entry of the record being accessed.

Returns

The type of the variable being accessed.

3.4.2.39 simpleExpr()

```
Type Parser::simpleExpr (  
    std::set< Symbol > stop ) [private]
```

Parses a simple expression from the stream of tokens.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

Returns

The type of the expression result.

3.4.2.40 stmt()

```
void Parser::stmt (  
    std::set< Symbol > stop ) [private]
```

Parses a statement.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

3.4.2.41 stmtPart()

```
void Parser::stmtPart (  
    std::set< Symbol > stop ) [private]
```

Parses the statement part of the program.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

3.4.2.42 syntaxCheck()

```
void Parser::syntaxCheck (
    std::set< Symbol > stop ) [private]
```

Checks the next token to see if it will be valid.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

3.4.2.43 syntaxError()

```
void Parser::syntaxError (
    std::set< Symbol > stop ) [private]
```

Process a syntax error and perform error recovery.

Parameters

<i>stop</i>	The stopsets used to recover from the error.
-------------	--

3.4.2.44 term()

```
Type Parser::term (
    std::set< Symbol > stop ) [private]
```

Parses a term from the stream of tokens.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

Returns

the resulting type of the term.

3.4.2.45 typeSym()

```
Type Parser::typeSym (
    std::set< Symbol > stop ) [private]
```

Parses a definition type from the stream of tokens.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

Returns

the type of the type symbol parsed.

3.4.2.46 vacsList()

```
std::vector<Type> Parser::vacsList (
    std::set< Symbol > stop ) [private]
```

Parses a variable access list.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

Returns

A vector of the types of the variables in the list in order.

3.4.2.47 varAccess()

```
Type Parser::varAccess (
    std::set< Symbol > stop,
    bool & isConst ) [private]
```

Parses variable access.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
<i>isConst</i>	Whether or not the variable being accessed is a const variable.
<i>return</i>	The type of the variable accessed.

3.4.2.48 varDef()

```
int Parser::varDef (
    std::set< Symbol > stop,
    int & start ) [private]
```

Parses a variable definition from the stream of tokens.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
<i>start</i>	The starting label for variable being defined.

Returns

the size of the variable defined.

3.4.2.49 varList()

```
std::vector<int> Parser::varList (
    std::set< Symbol > stop ) [private]
```

Parses a variable list from the stream of tokens.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
-------------	---

Returns

A vector of the symbol table index for each variable in the list.

3.4.2.50 vPrime()

```
int Parser::vPrime (
    std::set< Symbol > stop,
    Type type,
    int & start ) [private]
```

Parses a variable vs array from the stream of tokens.

Parameters

<i>stop</i>	The stopsets used to recover from an error.
<i>type</i>	The type of the table entry that is being created
<i>start</i>	The starting label for variable being defined.

Returns

the size of the variable defined.

3.4.2.51 writeStmt()

```
void Parser::writeStmt (
    std::set< Symbol > stop ) [private]
```

Parses a write statement.

Parameters

<code>stop</code>	The stopsets used to recover from an error.
-------------------	---

3.4.3 Member Data Documentation

3.4.3.1 admin

```
Administration& Parser::admin [private]
```

The administration object for errors and holding the scanner and symbol table.

3.4.3.2 blocks

```
BlockTable Parser::blocks [private]
```

Block table structure that keeps track of variables and their scope.

3.4.3.3 label

```
int Parser::label [private]
```

3.4.3.4 look

```
Token Parser::look [private]
```

The look ahead token.

The documentation for this class was generated from the following file:

- [Parser.h](#)

3.5 Scanner Class Reference

```
#include <Scanner.h>
```

Public Member Functions

- [Scanner](#) (std::istream &ifs, [SymbolTable](#) &symTab)
Constructor for the scanner, initializes the private variables to appropriate values.
- [~Scanner](#) ()
Destructor of the scanner.
- [Token](#) [getToken](#) ()
Get the next [Token](#) in the line.

Private Member Functions

- bool [isWhitespace](#) (char inchar)
Checks the input symbol against Whitespace whether tab or space.
- bool [isSpecial](#) (char inchar)
Checks the input char against all possible symbols.
- [Token](#) [recognizeName](#) ()
Read and generate tokens for keywords and ID's, also checks for invalid characters and returns a [CHAR_ERR](#) token and checks the symbol table is filled then return a [FULL_TAB](#) error token.
- [Token](#) [recognizeSpecial](#) ()
Read and generate a token for any of the special symbols.
- [Token](#) [recognizeNumeral](#) ()
Read and generate a token for any number/digit.

Private Attributes

- std::istream & [fin](#)
The file stream.
- [SymbolTable](#) & [symTab](#)
The symbol table.
- std::string [line](#)
The current line the scanner is reading.
- std::size_t [pos](#)
The position of the char the scanner is reading.

3.5.1 Constructor & Destructor Documentation

3.5.1.1 Scanner()

```
Scanner::Scanner (
    std::istream & ifs,
    SymbolTable & symTab )
```

Constructor for the scanner, initializes the private variables to appropriate values.

Parameters

<i>ifs</i>	The file stream.
<i>symTab</i>	The symbol table

3.5.1.2 ~Scanner()

```
Scanner::~Scanner ( ) [inline]
```

Destructor of rthe scanner.

3.5.2 Member Function Documentation**3.5.2.1 getToken()**

```
Token Scanner::getToken ( )
```

Get the next [Token](#) in the line.

3.5.2.2 isSpecial()

```
bool Scanner::isSpecial (
    char inchar ) [private]
```

Checks the inputed char against all possible symbols.

Parameters

<i>inchar</i>	The current char being read in
---------------	--------------------------------

Returns

true if the char is a special symbol, false otherwise.

3.5.2.3 isWhitespace()

```
bool Scanner::isWhitespace (
    char inchar ) [private]
```

Checks the input symbol against Whitespace whether tab or space.

Parameters

<i>inchar</i>	The current char being read in
---------------	--------------------------------

Returns

true if the char is whitespace, false otherwise.

3.5.2.4 recognizeName()

```
Token Scanner::recognizeName ( ) [private]
```

Read and generate tokens for keywords and ID's, also checks for invalid characters and returns a CHAR_ERR token and checks the symbol table is filled then return a FULL_TAB error token.

Returns

An ID or keyword token for the scanned lexeme, or an error token.

3.5.2.5 recognizeNumeral()

```
Token Scanner::recognizeNumeral ( ) [private]
```

Read and generate a token for any number/digit.

Returns

a token for the number with the actual value in it.

3.5.2.6 recognizeSpecial()

```
Token Scanner::recognizeSpecial ( ) [private]
```

Read and generate a token for any of the special symbols.

Returns

a token for the special symbol scanned.

3.5.3 Member Data Documentation

3.5.3.1 fin

```
std::istream& Scanner::fin [private]
```

The file stream.

3.5.3.2 line

```
std::string Scanner::line [private]
```

The current line the scanner is reading.

3.5.3.3 pos

```
std::size_t Scanner::pos [private]
```

The position of the char the scanner is reading.

3.5.3.4 symTab

```
SymbolTable& Scanner::symTab [private]
```

The symbol table.

The documentation for this class was generated from the following file:

- [Scanner.h](#)

3.6 SymbolTable Class Reference

```
#include <SymbolTable.h>
```

Public Member Functions

- [SymbolTable](#) ()
- int [search](#) (const std::string &str)
Searches for a lexeme in the symbol table and returns its token.
- int [insert](#) (const std::string &str)
Inserts a new lexeme into the symbol table if it is not already there.
- [Token](#) & [getToken](#) (int idx, bool &found)
Get a reference to the token in the symbol table by its index.
- int [hash](#) (const std::string &str)
Computes a rolling hash for a given string using the MOD constant.
- bool [full](#) ()
Returns true if the table is full.
- int [getLoad](#) ()
Returns the number items in the table.
- std::string [toString](#) ()
Returns a string representation of the table.

Private Member Functions

- `std::pair< int, Token & > probe` (int idx, std::string lexeme)
Given a position linear probe until the token with the given lexeme is found or an empty token is found.
- `void loadKey` (Symbol sym, const std::string &lexeme)
Load a token for a reserved keyword into the table.
- `void loadKeywords` ()
Loads all reserved keywords into the symbol table.

Private Attributes

- `std::vector< Token > table`
Backing array for the hash table.
- `int load`
The number of elements in the hash table.

3.6.1 Constructor & Destructor Documentation

3.6.1.1 SymbolTable()

```
SymbolTable::SymbolTable ( )
```

3.6.2 Member Function Documentation

3.6.2.1 full()

```
bool SymbolTable::full ( )
```

Returns true if the table is full.

3.6.2.2 getLoad()

```
int SymbolTable::getLoad ( )
```

Returns the number items in the table.

3.6.2.3 getToken()

```
Token& SymbolTable::getToken (
    int idx,
    bool & found )
```

Get a reference to the token in the symbol table by its index.

Parameters

<i>idx</i>	The index of the token.
<i>found</i>	

Returns

a reference to the token or a dummy empty token.

Exceptions

<i>out_of_range</i>	error if the <i>idx</i> is out of bounds.
---------------------	---

3.6.2.4 hash()

```
int SymbolTable::hash (
    const std::string & str )
```

Computes a rolling hash for a given string using the MOD constant.

Only looks at a max of 10 characters from the string.

Parameters

<i>str</i>	The string to hash.
------------	---------------------

Returns

the integer hash value of the string.

3.6.2.5 insert()

```
int SymbolTable::insert (
    const std::string & str )
```

Inserts a new lexeme into the symbol table if it is not already there.

Parameters

<i>str</i>	Insert a string into the hash table.
------------	--------------------------------------

Returns

The index of the token in the symbol table, or -1 if it exists.

Exceptions

<i>length_error</i>	if the symbol table is full.
---------------------	------------------------------

3.6.2.6 loadKey()

```
void SymbolTable::loadKey (
    Symbol sym,
    const std::string & lexeme ) [private]
```

Load a token for a reserved keyword into the table.

Parameters

<i>lexeme</i>	The tokens's lexeme.
<i>sym</i>	The token's symbol.

3.6.2.7 loadKeywords()

```
void SymbolTable::loadKeywords ( ) [private]
```

Loads all reserved keywords into the symbol table.

3.6.2.8 probe()

```
std::pair<int, Token&> SymbolTable::probe (
    int idx,
    std::string lexeme ) [private]
```

Given a position linear probe until the token with the given lexeme is found or an empty token is found.

Parameters

<i>idx</i>	The initial position to start probing. Generally the lexemes hash value.
<i>lexeme</i>	The lexeme to probe for.

Returns

a pair with the position of the token and the lexeme.

3.6.2.9 search()

```
int SymbolTable::search (
    const std::string & str )
```

Searches for a lexeme in the symbol table and returns its token.

Parameters

<i>str</i>	The lexeme to search for.
------------	---------------------------

Returns

The index of the token in the symbol table, or -1 for not found.

3.6.2.10 toString()

```
std::string SymbolTable::toString ( )
```

Returns a string representation of the table.

3.6.3 Member Data Documentation**3.6.3.1 load**

```
int SymbolTable::load [private]
```

The number of elements in the hash table.

3.6.3.2 table

```
std::vector<Token> SymbolTable::table [private]
```

Backing array for the hash table.

The documentation for this class was generated from the following file:

- [SymbolTable.h](#)

3.7 TableEntry Class Reference

```
#include <TableEntry.h>
```

Public Member Functions

- [TableEntry](#) ()
Default Constructor that creates a empty table entry set to default values.
- [TableEntry](#) (int nid, [Kind](#) nkind, [Type](#) ntype, int nsize, int nval, int disp)
Overloaded constructor that creates the table entry with the input values.
- int [findEntry](#) ([TableEntry](#) &entry)
Check if the table entry input is a param or field of a procedure or record.
- int [findEntry](#) (int id)
Overloaded function to check if a table entry is a param or field using its id of a procedure or record.

Public Attributes

- int [id](#)
The table entry id.
- [Kind](#) [tkind](#)
The kind of table entry.
- [Type](#) [ttype](#)
The type of the table entry.
- int [size](#)
The size of the required memory for the table entry.
- int [val](#)
The value of the table entry.
- std::vector< [TableEntry](#) > [entries](#)
The field/params of a record/procedure respectively.
- int [level](#)
The level in the block table.
- int [displace](#)
The displacement from the start label.
- int [startLabel](#)
The start label for the variable.

3.7.1 Constructor & Destructor Documentation

3.7.1.1 [TableEntry](#)() [1/2]

```
TableEntry::TableEntry ( ) [inline]
```

Default Constructor that creates a empty table entry set to default values.

3.7.1.2 TableEntry() [2/2]

```
TableEntry::TableEntry (
    int nid,
    Kind nkind,
    Type ntype,
    int nsize,
    int nval,
    int disp ) [inline]
```

Overloaded constructor that creates the table entry with the input values.

Parameters

<i>nid</i>	The id of the table entry
<i>nkind</i>	The Kind of the table entry
<i>ntype</i>	The Type of the table entry
<i>nsize</i>	The memory size required by the table entry
<i>nval</i>	The value of the table entry
<i>disp</i>	The amount of displacement from the variables startLabel

3.7.2 Member Function Documentation

3.7.2.1 findEntry() [1/2]

```
int TableEntry::findEntry (
    TableEntry & entry ) [inline]
```

Check if the table entry input is a param or field of a procedure or record.

Parameters

<i>entry</i>	The table entry being searched for
--------------	------------------------------------

3.7.2.2 findEntry() [2/2]

```
int TableEntry::findEntry (
    int id ) [inline]
```

Overloaded function to check if a table entry is a param or field using its id of a procedure or record.

Parameters

<i>The</i>	id of the table entry being searched for
------------	--

3.7.3 Member Data Documentation

3.7.3.1 displace

```
int TableEntry::displace
```

The displacement from the start label.

3.7.3.2 entries

```
std::vector<TableEntry> TableEntry::entries
```

The field/params of a record/procedure respectively.

3.7.3.3 id

```
int TableEntry::id
```

The table entry id.

3.7.3.4 level

```
int TableEntry::level
```

The level in the block table.

3.7.3.5 size

```
int TableEntry::size
```

The size of the required memory for the table entry.

3.7.3.6 startLabel

```
int TableEntry::startLabel
```

The start label for the variable.

3.7.3.7 tkind

```
Kind TableEntry::tkind
```

The kind of table entry.

3.7.3.8 ttype

```
Type TableEntry::ttype
```

The type of the table entry.

3.7.3.9 val

```
int TableEntry::val
```

The value of the table entry.

The documentation for this class was generated from the following file:

- [TableEntry.h](#)

3.8 Token Class Reference

```
#include <Token.h>
```

Public Member Functions

- [Token](#) ()
Creates a new default token.
- [Token](#) ([Symbol](#) sym, std::string [lexeme](#)="", int [val](#)=-1)
Creates a new token.
- [Token](#) (const [Token](#) &tok)
Copy Constructor.
- [Symbol](#) [getSymbol](#) () const
Returns the symbol.
- std::string [getLexeme](#) () const
Returns the lexeme.
- int [getVal](#) () const
Returns the value.
- void [setSymbol](#) ([Symbol](#) sym)
Sets the symbol.
- void [setLexeme](#) (std::string [lexeme](#))
Sets the lexeme.
- void [setVal](#) (int [val](#))
Sets the value.
- std::string [toString](#) ()
Returns a string representation of the [Token](#).

Private Attributes

- [Symbol](#) [sname](#)
The token's symbol.
- std::string [lexeme](#)
The tokens lexeme.
- int [val](#)
The numeric value of the token.

3.8.1 Constructor & Destructor Documentation

3.8.1.1 [Token\(\)](#) [1/3]

```
Token::Token ( )
```

Creates a new default token.

Sets Symbol to EMPTY, lexeme to "", and value to -1.

3.8.1.2 [Token\(\)](#) [2/3]

```
Token::Token (
    Symbol sym,
    std::string lexeme = "",
    int val = -1 )
```

Creates a new token.

Parameters

<i>sym</i>	The symbol for the token.
<i>lexeme</i>	The lexeme for the token. Default "".
<i>val</i>	The numerical value to give to the token. Default -1.

3.8.1.3 Token() [3/3]

```
Token::Token (
    const Token & tok )
```

Copy Constructor.

3.8.2 Member Function Documentation**3.8.2.1 getLexeme()**

```
std::string Token::getLexeme ( ) const
```

Returns the lexeme.

3.8.2.2 getSymbol()

```
Symbol Token::getSymbol ( ) const
```

Returns the symbol.

3.8.2.3 getVal()

```
int Token::getVal ( ) const
```

Returns the value.

3.8.2.4 setLexeme()

```
void Token::setLexeme (
    std::string lexeme )
```

Sets the lexeme.

Parameters

<i>lexeme</i>	The lexeme to give the token.
---------------	-------------------------------

3.8.2.5 setSymbol()

```
void Token::setSymbol (
    Symbol sym )
```

Sets the symbol.

Parameters

<i>sym</i>	The symbol to give the token.
------------	-------------------------------

3.8.2.6 setVal()

```
void Token::setVal (
    int val )
```

Sets the value.

Parameters

<i>val</i>	The value to give the token.
------------	------------------------------

3.8.2.7 toString()

```
std::string Token::toString ( )
```

Returns a string representation of the [Token](#).

3.8.3 Member Data Documentation

3.8.3.1 lexeme

```
std::string Token::lexeme [private]
```

The tokens lexeme.

3.8.3.2 `sname`

```
Symbol Token::sname [private]
```

The token's symbol.

3.8.3.3 `val`

```
int Token::val [private]
```

The numeric value of the token.

The documentation for this class was generated from the following file:

`ACT_PARAM`, `SELECT`, `FIELD_SEL`, `CPRIME` }

Enum to represent all non terminals that are possible in our language.

Functions

- bool `in` (std::set< `Symbol` > S, `Symbol` sym)
Check if a symbol is in a set.
- std::set< `Symbol` > `munion` (std::vector< std::set< `Symbol` >> stopSets)
Union a vector of stopsets together.

Variables

- const std::map< `NT`, std::set< `Symbol` > > `First`
Map from non terminals to thier first sets of symbols.

4.4.1 Enumeration Type Documentation

4.4.1.1 NT

```
enum NT
```

Enum to represent all non terminals that are possible in our language.

4.4.2 Function Documentation

4.4.2.1 in()

```
bool in (
    std::set< Symbol > S,
    Symbol sym )
```

Check if a symbol is in a set.

Helper for checking stop set membership.

Parameters

<i>S</i>	The symbol set to check.
<i>sym</i>	The symbol to check.

Returns

true if sym is in S.

4.4.2.2 munion()

```
std::set<Symbol> munion (
    std::vector< std::set< Symbol >> stopSets )
```

Union a vector of stopsets together.

Parameters

<i>stopSets</i>	A vector of Symbol sets to union.
-----------------	-----------------------------------

Returns

a set of all of the given stopsets.

4.4.3 Variable Documentation

4.4.3.1 First

```
const std::map<NT, std::set<Symbol> > First
```

Map from non terminals to thier first sets of symbols.

4.5 Parser.h File Reference

```
#include <iostream>
#include <set>
#include "Symbol.h"
#include "Token.h"
#include "TableEntry.h"
#include "Administration.h"

4.7.2 Variable Documentation

4.7.2.1 SpecialSym

```
const std::map<std::string, Symbol> SpecialSym
```

Initial value:

```
{
    { ".", Symbol::DOT },
    { ",", Symbol::COMMA },
    { ";", Symbol::SEMI },
    { "[", Symbol::LHSQR },
    { "]", Symbol::RHSQR },
    { "&", Symbol::AMP },
    { "|", Symbol::BAR },
    { "~", Symbol::TILD },
    { "<", Symbol::LESS },
    { "=", Symbol::EQUAL },
    { ">", Symbol::GREAT },
    { "+", Symbol::PLUS },
    { "-", Symbol::MINUS },
    { "*", Symbol::TIMES },
    { "/", Symbol::FSLASH },
    { "\\ ", Symbol::BSLASH },
    { "(", Symbol::LHRND },
    { ")", Symbol::RHRND },
    { ":", Symbol::INIT },
    { "[ ]", Symbol::GUARD },
    { "->", Symbol::ARROW }
}
```

Map for all special lexemes to their symbol.

4.7.2.2 SymbolToString

```
const std::map<Symbol, std::string> SymbolToString
```

Map from all symbols to string versions of themselves for printing.

4.7.2.3 WordSym

```
const std::map<std::string, Symbol> WordSym
```

Initial value:

```
{
  {"begin", Symbol::BEGIN},
  {"end", Symbol::END},
  {"const", Symbol::CONST},
  {"array", Symbol::ARRAY},
  {"proc", Symbol::PROC},
  {"skip", Symbol::SKIP},
  {"read", Symbol::READ},
  {"write", Symbol::WRITE},
  {"call", Symbol::CALL},
  {"if", Symbol::IF},
  {"fi", Symbol::FI},
  {"do", Symbol::DO},
  {"od", Symbol::OD},
  {"integer", Symbol::INT},
  {"Boolean", Symbol::BOOL},
  {"true", Symbol::TRUE},
  {"false", Symbol::FALSE},
  {"record", Symbol::RECORD},
  {"var", Symbol::VAR},
  {"float", Symbol::FLOAT}
}
```

Map for all keywords (word symbols) to their symbol.

4.8 SymbolTable.h File Reference

```
#include "Token.h"
#include <vector>
#include <string>
```

4.11 Types.h File Reference

Enumerations

- enum [Kind](#) {
 [CONSTANT](#) =500, [VARIABLE](#), [K_ARRAY](#), [PROCEDURE](#),
 [UNDEFINED](#), [K_RECORD](#) }
Enum containing all the kinds of table entries.
- enum [Type](#) { [INTEGER](#) =600, [BOOLEAN](#), [UNIVERSAL](#), [T_FLOAT](#) }
Enum containing all the Types of table entries.

Variables

- const std::map< [Kind](#), std::string > [KindToString](#)
Mapping the Kinds to strings representing the kinds.
- const std::map< [Type](#), std::string > [TypeToString](#)
Mapping the Type to strings representing the types.

4.11.1 Enumeration Type Documentation

4.11.1.1 Kind

enum [Kind](#)

Enum containing all the kinds of table entries.

Enumerator

CONSTANT	
VARIABLE	
K_ARRAY	
PROCEDURE	
UNDEFINED	
K_RECORD	

4.11.1.2 Type

enum [Type](#)

Enum containing all the Types of table entries.

Enumerator

INTEGER	
BOOLEAN	
UNIVERSAL	
T_FLOAT	

4.11.2 Variable Documentation

4.11.2.1 KindToString

```
const std::map<Kind, std::string> KindToString
```

Initial value:

```
{
  {CONSTANT, "'Constant'"},
  {VARIABLE, "'Variable'"},
  {K_ARRAY, "'Array'"},
  {PROCEDURE, "'Procedure'"},
  {UNDEFINED, "'Undefined'"},
  {K_RECORD, "'Record'"}
}
```

Mapping the Kinds to strings representing the kinds.

4.11.2.2 TypeToString

```
const std::map<Type, std::string> TypeToString
```

Initial value:

```
{
  {INTEGER, "'Integer'"},
  {BOOLEAN, "'Boolean'"},
  {UNIVERSAL, "'Universal'"},
  {T_FLOAT, "'Float'"}
}
```

Mapping the Type to strings representing the types.
